

COMPANY PROFILE

ABOUT US

Mantua Cybersecurity is a cybersecurity services company with operations in the Philippines and Singapore that helps organizations secure their systems by providing cybersecurity services. We create value for our customers by assisting them to achieve the most cost-effective path to satisfy their cybersecurity requirements.

Mantua Cybersecurity was founded by Jonathan Mantua and Celia Mantua. Together, they built Mantua Cybersecurity from the ground with the network of partners they have worked with and later opened up a Singapore outfit. Since then, the company has provided information security services to a wide range of clients ranging from small businesses to large corporations such as banks, publicly traded companies, multinational companies, and healthcare providers, both in the Philippines and Singapore.

Included in Mantua's portfolio are auditing policies and control, Vulnerability Assessment and Penetration Testing (VAPT), and preparation of recommendations and reports for improvements to overall information of the security posture of their clients. Mantua Cybersecurity is recognized by the Department of Information and Communications Technology (DICT) as a Cybersecurity Assessment Provider.

Mantua Cybersecurity aims to provide the South East Asia market a world-class quality Security and Data Privacy package and is currently expanding to USA and Australian markets.

ACCREDITATIONS & CERTIFICATIONS:

Philippines:

-Department of Information and Communications Technology recognized VAPT & ISMS provider

Singapore:

Cybersecurity Services Regulation Office
Licensed Penetration Testing Service and
Managed Security Operations Centre
Monitoring Provider

ISO 9001 & 27001 Certified

SECURITY TESTING SERVICES

Vulnerability Assessment and Penetration Testing

Evaluate the current security state of your network infrastructure, servers, web, and mobile applications by conducting Vulnerability Assessment and Penetration Testing (VAPT). Try attacks and exploits on your system before real malicious actors do. Know where to better invest in cybersecurity by knowing your weaknesses and vulnerabilities.

Secure Code Review

Ensure that your applications are secure by having them reviewed for security, design flaws, and conformity to programming language-specific best practices. Code review also ensures that the Open Web Application Security Project (OWASP) recommended best practices are followed, ensuring that the code you deploy is secured.

Phishing Campaign Testing

Test your employee's security awareness by performing a simulated phishing attack. Your employees will be sent a malicious email from a fraudulent domain with a link leading to a fake web application, and the management will be given a report and assessment of whether the employees opened the email, clicked the link, and filled out the form from the fake web application.

SECURITY TESTING SERVICES

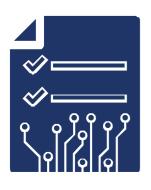

Red Teaming Exercises

Check your company's Blue Team capabilities by performing Red Teaming Exercises. This campaign is composed of different scenarios that can happen in real life but conducted in a controlled environment and coordinated with the client. Some of the methods include but are not limited to Ransomware Infection, Rogue Access Point, and Malicious USB drops.

Load and Performance Testing

Determine failures and slowdown of software systems. This service can also profile maximum threshold of simultaneous users and transactions being executed. Identify and verify the system's bottlenecks, and potential scalability problems early on so organizations are better advised in potential future investments to grow their user-base and operations.

Smart Contract Audit

Smart contract auditing is a thorough analysis of blockchain applications' smart contracts to correct design issues, errors in the code, and security vulnerabilities.

This is usually done side-by-side with the review of a project's white paper to give potential investors and users peace of mind.

MONITORING SERVICES

Security Operations Centre as a Service (SOCaaS)

We provide trained cybersecurity engineers with vast experience in running SOC operations and SIEM tools to help you with monitoring the logs of your system. This is to to ensure that threats are detected and remediated as soon as possible. Our team will work 24 x 7 with our proprietary in-house built monitoring systems to monitor any type of logs you send our way.

Web Defacement Monitoring

Web defacement refers to unauthorized access in which malicious parties penetrate a website and inserts malicious codes, images, and contents that can severely damage your organization's image and reputation. Web and security defacement monitoring can monitor and detect these hacking activities before these affect your website and customers.

Application Monitoring

Keep your systems and customer data safe by identifying and monitoring suspicious activities. Our cybersecurity engineers can detect malicious patterns based on user behavior, data, and transactions.

Information Security Consulting

Meet your demands for enterprise information security management when you lack the internal resources to do so. We will help you develop a cyber security strategy to ensure that sensitive information and your IT infrastructure are protected from ever evolving threats.

AUDIT SERVICES

IT and Data Privacy Audit

Assess and evaluate your organization's IT infrastructure, policies, and operations to determine whether controls are in place to ensure protection of information, IT assets, and compliance with known legislations, regulations, and industry standards such as Data Privacy Act, Payment Card Industry Data Security Standard (PCI-DSS), General Data Protection Regulation (GDPR), and so on. By performing a comprehensive IT audit in your organization, risks are addressed and managed in an effective, and cost-effective manner.

IT Forensics

Comprises of recovery and investigation of material found in digital devices, often in the event of a computer crime, like ransomware attacks or digital theft. Our security engineers follow the digital forensic investigation process for acquisition of imaging of devices, analysis, and reporting. IT Forensics likewise ensures that the integrity and authenticity of the digital evidence are maintained and admissible for legal purposes.

ISO 9001 and ISO 27001 Certification

We provide and support organizations by gaining similar international standards and recognition levels through the documentation process to the certification of ISO 9001 (Quality Management System) and ISO 27001 (Information Security Management System).
